Description

The PI5A23159 is a dual high-bandwidth, fast single-pole double-throw (SPDT) CMOS switch. It can be used as an analog switch or as a low-delay bus switch. The device features ultra low RON of 0.8Ω typical at 3.0V V_{CC} and will operate over the wide V_{CC} range of 1.65V to 5.5V.

The PI5A23159 features very low quiescent current even when the control voltage is lower than the V_{CC} supply. This feature services the mobile handset applications very well by allowing direct interface with baseband processor general purpose I/Os. Break-before-make switching prevents both switches being enabled simultaneously. This eliminates signal disruption during switching.

The control input, S, is independent of supply voltage.

Notes:

- Measured by voltage drop between A and B pins at the indicated current through the device. ON resistance is determined by the lower of the voltages on two ports (Ax or nBx) $x=0$ or 1 , $n=0$ or 1 .
- Parameter is characterized but not tested in production.
- $\Delta R_{ON} = R_{ON \text{ max}} - R_{ON \text{ min}}$, measured at identical V_{CC} , temperature and voltage levels.
- Flatness is defined as difference between maximum and minimum value of ON resistance over the specified range of conditions.
