

Am2926 • Am2929

Schottky Three-State Quad Bus Driver/Receiver

Distinctive Characteristics

- Advanced Schottky technology
- 48mA driver sink current
- 3-state outputs on driver and receiver
- PNP inputs
- Am2926 has inverting outputs
- Am2929 has non-inverting outputs

- Driver propagation delay – 14ns max for Am2926; 17ns max for Am2929
- Receiver propagation delay – 14ns max for Am2926; 17ns max for Am2929

FUNCTIONAL DESCRIPTION

The Am2926 and Am2929 are high speed bus transceivers consisting of four bus drivers with three-state outputs and four bus receivers, also with three-state outputs. Each driver output is internally connected to a receiver input. Both the drivers and receivers have PNP inputs.

One buffered common "bus enable" input is connected to the four drivers and another buffered common "receiver enable" input is connected to the receivers. A LOW on the bus enable (B/E) input forces the four driver outputs to the high-impedance state. A HIGH on the bus enable allows input data to be transferred onto the data bus.

A HIGH on the receiver enable ($\overline{R}/\overline{E}$) input forces the four receiver outputs to the high-impedance state while a LOW on the receiver enable input allows the received data to be transferred to the output. The complementary design of the bus enable and receiver enable inputs allows these control inputs to be connected together externally such that a single transmit/receive function is derived.

Notes: 1. For conditions shown as MIN. or MAX., use the appropriate value specified under Electrical Characteristics for the applicable device type.

2. Typical limits are at V_{CC} = 5.0 V, 25°C ambient and maximum loading.

3. Actual input currents = Unit Load Current x Input Load Factor (See Loading Rules).

4. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.

5. Output sink current is supplied through a resistor to V_{CC}.

6. Measurements apply to each output and the associated data input independently.

DEFINITION OF FUNCTIONAL TERMS

D₀, D₁, D₂, D₃ The four driver inputs.

B₀, B₁, B₂, B₃ The four driver outputs and receiver inputs (data is inverted).

R₀, R₁, R₂, R₃ The four receiver outputs. Data from the bus is inverted while data from the driver inputs is non-inverted.

B/E Bus enable input. When the bus enable input is LOW, the four driver outputs are in the high-impedance state.

R/E Receiver enable input. When the receiver enable input is HIGH, the four receiver outputs are in the high-impedance state.

Notes:

- Notes:
1. P = Molded DIP, D = Hermetic DIP, F = Flat Pak. Number following letter is number of leads. See Appendix B for detailed outline. Where Appendix B contains several dash numbers, any of the variations of the package may be used unless otherwise specified.
 2. C = 0 to 70°C, $V_{CC} = 4.75V$ to $5.25V$, M = -55 to + 125°C, $V_{CC} = 4.50V$ to $5.50V$.
 3. See Appendix A for details of screening. Levels C-1 and C-3 conform to MIL-STD-883, Class C. Level B-3 conforms to MIL-STD-883, Class B.
