Binary Counter with Synchronous Clear

General Description

These (synchronous presettable up) counters are monolithic complementary MOS (CMOS) integrated circuits constructed with N- and P-channel enhancement mode transistors. They feature an internal carry lookahead for fast counting schemes and for cascading packages without additional gating.

A low level at the load input disables counting and causes the outputs to agree with the data input after the next positive clock edge. The clear function for the C162 and C163 is synchronous and a low level at the clear input sets all four outputs low after the next positive clock edge. The clear function for the C160 and C161 is asynchronous and a low level at the clear inputs sets all four outputs low regardless of the state of the clock.

Counting is enabled when both count enable inputs are high. Input T is fed forward to also enable the carry out. The

carry output is a positive pulse with a duration approximately equal to the positive portion of Q_A and can be used to enable successive cascaded stages. Logic transitions at the enable P or T inputs can occur when the clock is high or low.

Features

- High noise margin
 - High noise immunity
 - Tenth power TTL compatible
 - Wide supply voltage range
 - Internal look-ahead for fast counting schemes
 - Carry output for N-bit cascading
 - Load control line
 - Synchronously programmable
- 1V guaranteed
 0.45 V_{CC} (typ.)
 Drives 2 LPTTL loads
 3V to 15V

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.
