

## DESCRIPTION

The MP62040/MP62041 Power Distribution Switch is designed for high-side load switch. The switch operates from 1.7V to 5.5V nominal input voltage and includes an 85mΩ power MOSFET to handle up to 2A continuous load.

The MP62040/MP62041 has slew rate control with 115 $\mu$ s rising time to limit inrush current when enabling the switch.

The built-in level shift function allows a logic signal on enable input that may be different from the supply voltage to switch the high side P-channel MOSFET ON or OFF.

The MP62040/MP62041 is available in an ultra-small UTQFN4 package, with ultra-low height (0.55mm typ).

## FEATURES

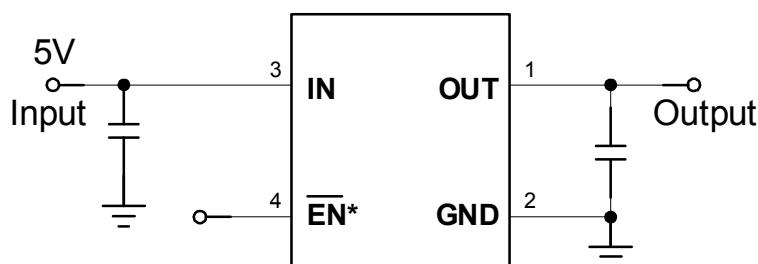

- 2A Continuous Current
- 1.7V to 5.5V Supply Range
- Soft Start: 115 $\mu$ s
- 1 $\mu$ A Shutdown Current
- 85mΩ MOSFET
- Active High & Active Low Options
- Space saving 1.6x1.2 mm UTQFN4 Package (0.55mm Height)

## APPLICATIONS

- Load switch in portable applications
- Battery switch-over circuits
- Level translator

### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J(\text{MAX})$ , the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $PD(\text{MAX})=(T_J(\text{MAX})-T_A)/\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) Pulse width <300μs and duty cycle < 2%
- 4) Continuous body diode conduction (reverse conduction) is not recommended.
- 5) Measured on JESD51-7, 4-layer PCB.

## DETAILED DESCRIPTION

The MP62040/MP62041 Power Distribution Switch is designed for high-side load switch. The switch operates from 1.7V to 5.5V nominal input voltage and can handle up to 2A continuous load.

### Enable

The logic pin disables the switch to reduce overall supply current. Once the EN pin reaches logic enable threshold, the MP62040/MP62041 is enabled and the supply current is very small, only 2 $\mu$ A.

## APPLICATION INFORMATION

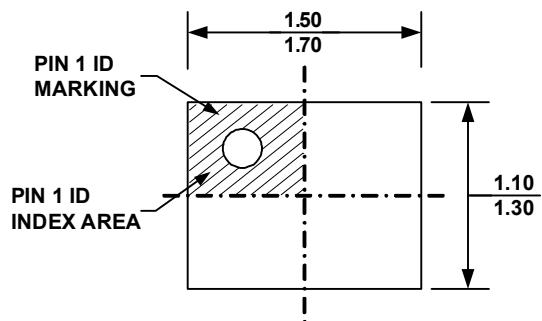

### Power-Supply Considerations

Over 10 $\mu$ F capacitor between IN and GND is recommended. This precaution reduces power-supply transients that may cause ringing on the input.

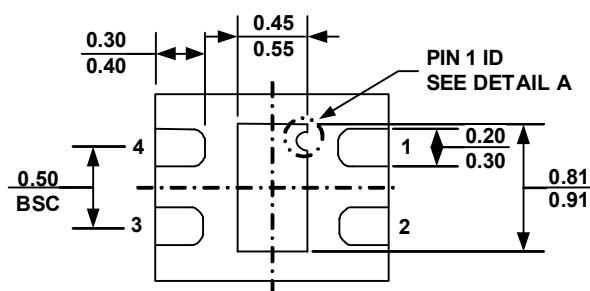

In order to achieve smaller output load transient ripple, placing a high-value electrolytic capacitor on the output pin(s) is recommended when the load is heavy.
