

Triple 8-Bit, 40MSPS, RGB, 3-Channel D/A Converter

The HI1178 is a triple 8-bit, high-speed, CMOS D/A converter designed for video band use. It has three separate, 8-bit, pixel inputs, one each for red, green, and blue video data. A single 5.0V power supply and pixel clock input is all that is required to make the device operational. A bias voltage generator is internal. Each channel clock input can be controlled individually, or connected together as one. The HI1178 also has BLANK video control signal.

Features

- Resolution Triple 8-Bit
- Maximum Conversion Speed 40MHz
- RGB 3-Channel Input/Output
- Differential Linearity Error +0.3 LSB
- Low Power Consumption 240mW (200Ω Load for 2V_{P-P} Output)
- Single Power Supply +5V
- Low Glitch Noise
- Direct Replacement for Sony CXD1178

Applications

- Digital TV
- Graphics Display
- High Resolution Color Graphics
- Video Reconstruction
- Instrumentation
- Image Processing

Notes On Operation

- How to select the output resistance

The HI1178 is a current-output D/A converter. To obtain the output voltage, connect the resistance to IO pin (RO, GO, BO). For specifications we have:

Output Full Scale Voltage $V_{FS} = \text{less than } 2.0 \text{ [V]}$

Output Full Scale Current I_{FS} = less than 15 [mA]

Calculate the output resistance value from the relation of $V_{FS} = I_{FS} \times R$. Also, 16 times resistance of the output resistance is connected to reference current pin I_{REF} . In some cases, however, this turns out to be a value that does not actually exist. In such a case a value close to it can be used as a substitute. Here please note that V_{FS} becomes $V_{FS} = V_{REF} \times 16R/R'$. R is the resistance connected to IO while R' is connected to I_{REF} . Increasing the resistance value can curb power consumption. On the other hand glitch energy and data settling time will inversely increase. Set the most suitable value according to the desired application.

- Phase Relation Between Data and Clock

To obtain the expected performance as a D/A converter, it is necessary to set properly the phase relation between data and clock applied from the exterior. Be sure to satisfy the provisions of the set up time (t_S) and hold time (t_H) as stipulated in the Electrical Characteristics.

- V_{DD}, V_{SS}

To reduce noise effects separate analog and digital systems in the device periphery. For V_{DD} pins, both digital and analog, bypass respective GNDs by using a ceramic capacitor of 0.1μF, as close as possible to the pin.
