Description

The CD74FCT843A and CD74FCT844A nine bit transparent latches use a small geometry BiCMOS technology. The output stage is a combination of bipolar and CMOS transistors that limits the output HIGH level to two diode drops below V_{CC} . This resultant lowering of output swing (0V to 3.7V) reduces power bus ringing (a source of EMI) and minimizes V_{CC} bounce and ground bounce and their effects during simultaneous output switching. The output configuration also enhances switching speed and is capable of sinking 48 milliamperes.

The CD74FCT843A and CD74FCT844A outputs are transparent to the inputs when the Latch Enable ($\overline{LE}$) is HIGH. When the Latch Enable ($\overline{LE}$) goes LOW, the data is latched. The Output Enable ($\overline{OE}$) controls the three state outputs. When the Output Enable ($\overline{OE}$) is HIGH, the outputs are in the high impedance state. The latch operation is independent of the state of the Output Enable. These devices, having Preset ($\overline{PRE}$) and Clear ($\overline{CLR}$), are ideal for parity bus interfacing. When $\overline{PRE}$ is low, the outputs are HIGH if $\overline{OE}$ is LOW. $\overline{PRE}$ overrides $\overline{CLR}$. When $\overline{CLR}$ is LOW, the outputs are LOW if $\overline{OE}$ is LOW. When $\overline{CLR}$ is HIGH, data can be entered into the latch.
